

Week 5: Multiple Rounds & Game Flow

Objective

The objective of Week 5 was to implement multiple rounds and improve the overall game flow of the Word Scramble Game. The player can now play several rounds continuously, receive different scrambled words, and choose whether to continue or exit the game. **Activities**

- Created a game loop using a `while` loop.
- Added multiple rounds to the game.
- Displayed the current round number.
- Selected a new random word in each round.
- Prevented duplicate word selection using `ArrayList`.
- Checked the player's answer using `equalsIgnoreCase()`.
- Updated the score when the answer was correct.
- Added a continue option after each round.
- Implemented the final game-over message and score display.

Implementation

The game starts with Round 1 and randomly selects a word from the word bank. The selected word is scrambled and displayed to the player. The player enters an answer, which is checked against the original word. If the answer is correct, the score increases. After each round, the player is asked whether they want to continue. The game continues until the player chooses to exit or all available words have been used.

Key Features

- Multiple Round System
- Random Word Selection
- Word Scrambling
- Duplicate Word Prevention
- Answer Validation
- Score Management
- Continue/Exit Option
- Final Score Display

Deliverables

- Updated `Week5.java`
- Multiple Round Game Loop
- Unique Word Selection System
- Score Tracking System
- Continue and Exit Game Flow

Expected Outcome

The Word Scramble Game can now run smoothly through multiple rounds. Each round provides a different scrambled word, prevents previously used words from appearing again, checks the player's answer, updates the score, and allows the player to continue or exit the game.
