

Week 4 Report: Score Management System

Objective:

The objective of Week 4 was to implement a Score Management System for the game. This stage focused on calculating and displaying the player's score based on correct and incorrect guesses. The scoring system was added to make the gameplay more interactive and engaging.

Activities Completed:

1. Score Variable Implementation

A score variable was created to store and manage the player's current score throughout the game.

2. Score Calculation

A scoring system was implemented where the player receives points for successfully guessing the correct word. The score is updated automatically after each valid guess.

3. Incorrect Guess Handling

The scoring logic was connected with the guess validation system. Correct guesses increase the score, while incorrect guesses do not add points.

4. Score Display

The current score was displayed on the console after each round so that the player could keep track of their performance.

5. Testing

The Score Management System was tested with multiple correct and incorrect guesses to ensure that the score was calculated and displayed correctly without errors.

Deliverables:

- Score Management Module
- Score Calculation Logic
- Updated Main.java
- Console Output with Current Score
- Tested Scoring System

Expected Outcome:

By the end of Week 4, the game was able to calculate and manage the player's score based on their guesses. The current score was displayed during gameplay, making the game more engaging and providing a basic scoring mechanism for future implementation of multiple rounds and advanced game features.
