

# Week 3 Report: User Input & Guess Validation

## Objective:

The objective of Week 3 was to implement user interaction by accepting the player's guessed word and validating it against the original word. This stage focused on improving the gameplay by providing feedback based on the user's input.

## Activities Completed:

### 1. User Input Implementation

The `Scanner` class was imported and configured to accept input from the keyboard. The player was prompted to enter the guessed word after viewing the scrambled word.

### 2. Guess Validation

The entered word was compared with the original word using a case-insensitive comparison method. This ensured that the player's answer was validated correctly regardless of letter case.

### 3. Result Display

A success message was displayed when the player's guess was correct, while an appropriate retry message was shown for incorrect guesses to improve the user experience.

### 4. Testing

The application was tested with multiple correct and incorrect guesses to verify that the input handling and validation logic worked properly without any errors.

## Deliverables

- User Input Module (`Scanner`)
- Guess Validation Logic
- Updated `Main.java`
- Console Output for Correct and Incorrect Guesses

## **Expected Outcome**

By the end of Week 3, the game was able to accept user input, validate the guessed word accurately, and display appropriate feedback. This completed the basic gameplay interaction and prepared the project for adding scoring and multiple rounds in the following weeks.
